

TOMATO

SuperSix 6-0-5 Organic Nitrogen Fertilizer

Recommended Tomato Application

We recommend using SuperSix for 25-50% of fertilizer needs per crop. Applying liquid fertilizers through a drip irrigation system can be 20-30% more efficient. Since nutrient needs can vary depending on the type of Tomatoes being grown; we recommend applying fertilizer during the peak growth stages. This is more efficient than merely applying a fixed goal of total nitrogen. SuperSix is best used in conjunction with a dry fertilizer pre-plant program. The average indeterminate crop total volume of SuperSix is suggested to be between 80-90 Gallons per acre. The suggested application timing is listed below, assuming efficient application.

Volume and Timing

lbs. of N per application

20G/Acre at planting	12
8G/Acre/Week First Fruit Cluster (dime size)	4.5
14 G/Acre/Week Clusters at dollar coin size	8
8 G/Acre/Week Peak to end of harvest	4.5

About SuperSix

- **Plant Available**
- **Easy-to-Use**
 - Particulate-free
 - Flows easily and cleanly through drip lines and through sprayers without clogging.
- **Food-safe**
 - OMRI listed for use on fruits and vegetables within days of harvest.
 - Both heat treated and ultra-filtered to ensure safety and quality.
